

Global impact of seasonal to inter-annual LAI: fluxes of moisture and heat.

Richard Ellis¹,

Christopher Taylor¹, Sietse Los².

Land-surface atmosphere coupling strength.

Koster et al 2002

Forcing data.

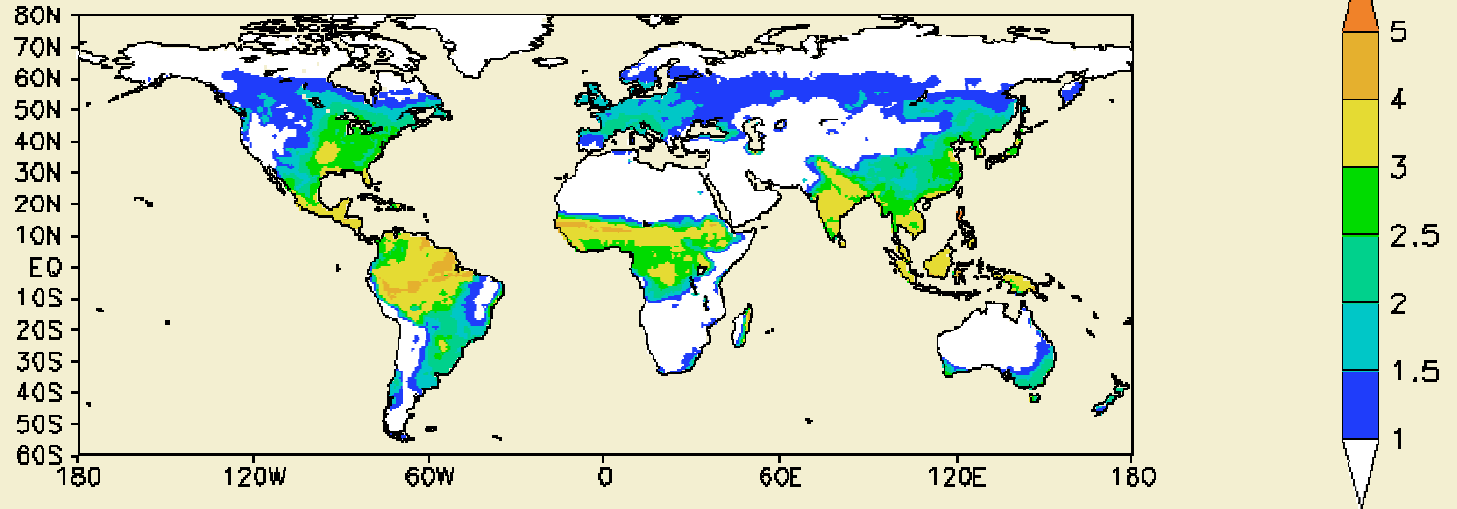

1. GSWP2

- 1 degree global coverage. Time step of 3 hours.
- Covers the years 1986-1995.
- Short wave radiation, long wave radiation, liquid precipitation, solid precipitation, surface temperature and surface pressure. <http://www.iges.org/gswp2/>

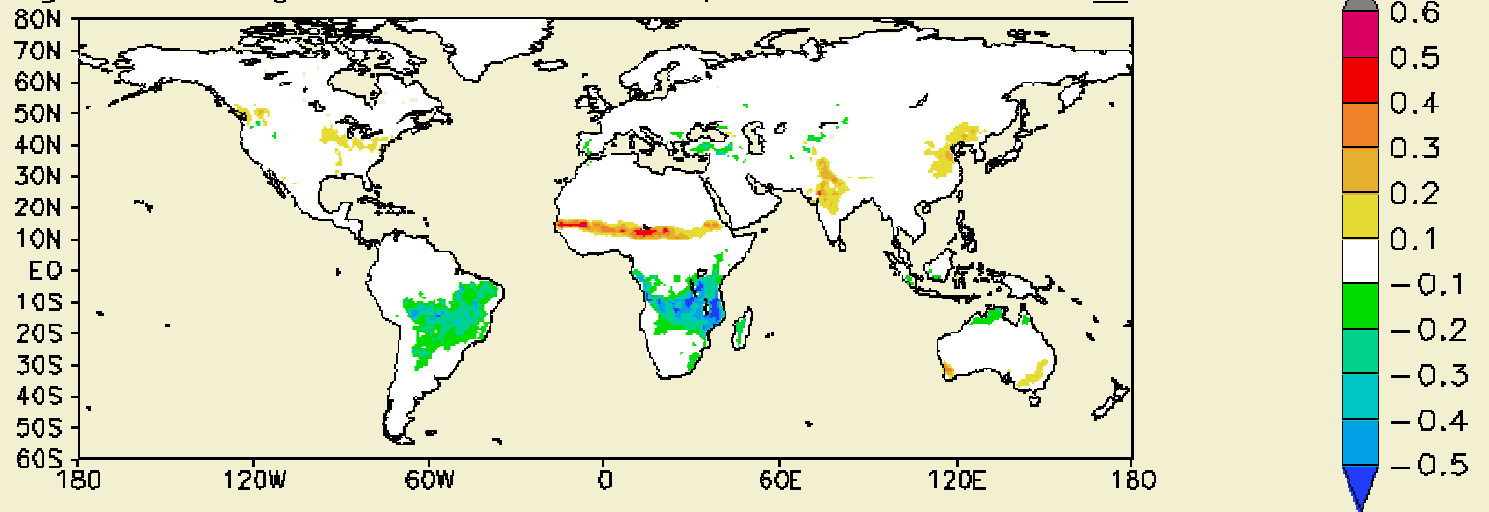

2. fAPAR

- 1degree/8km global coverage. Time step of 10 days.
- Covers the years 1982-1999. (<http://www.neodc.rl.ac.uk/>)

August evaporation VARY_LAI /mm day⁻¹

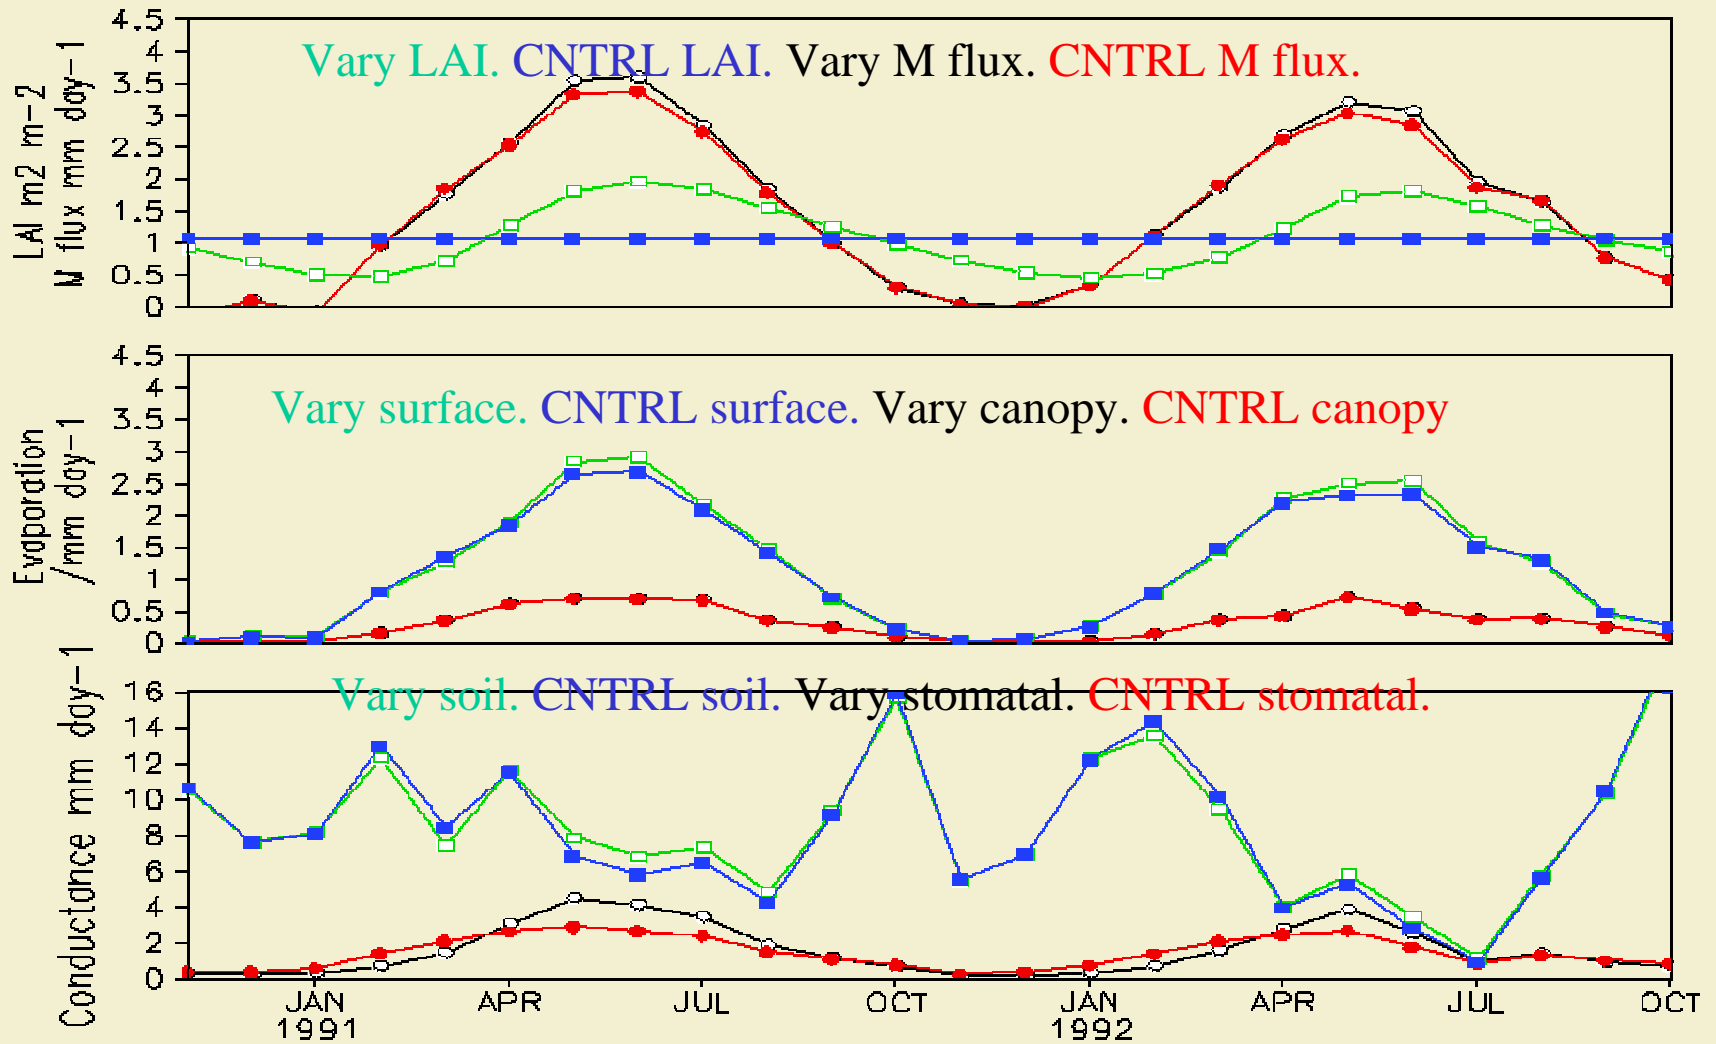

Percentage change AUGUST evaporation VARY_LAI-CNTRL

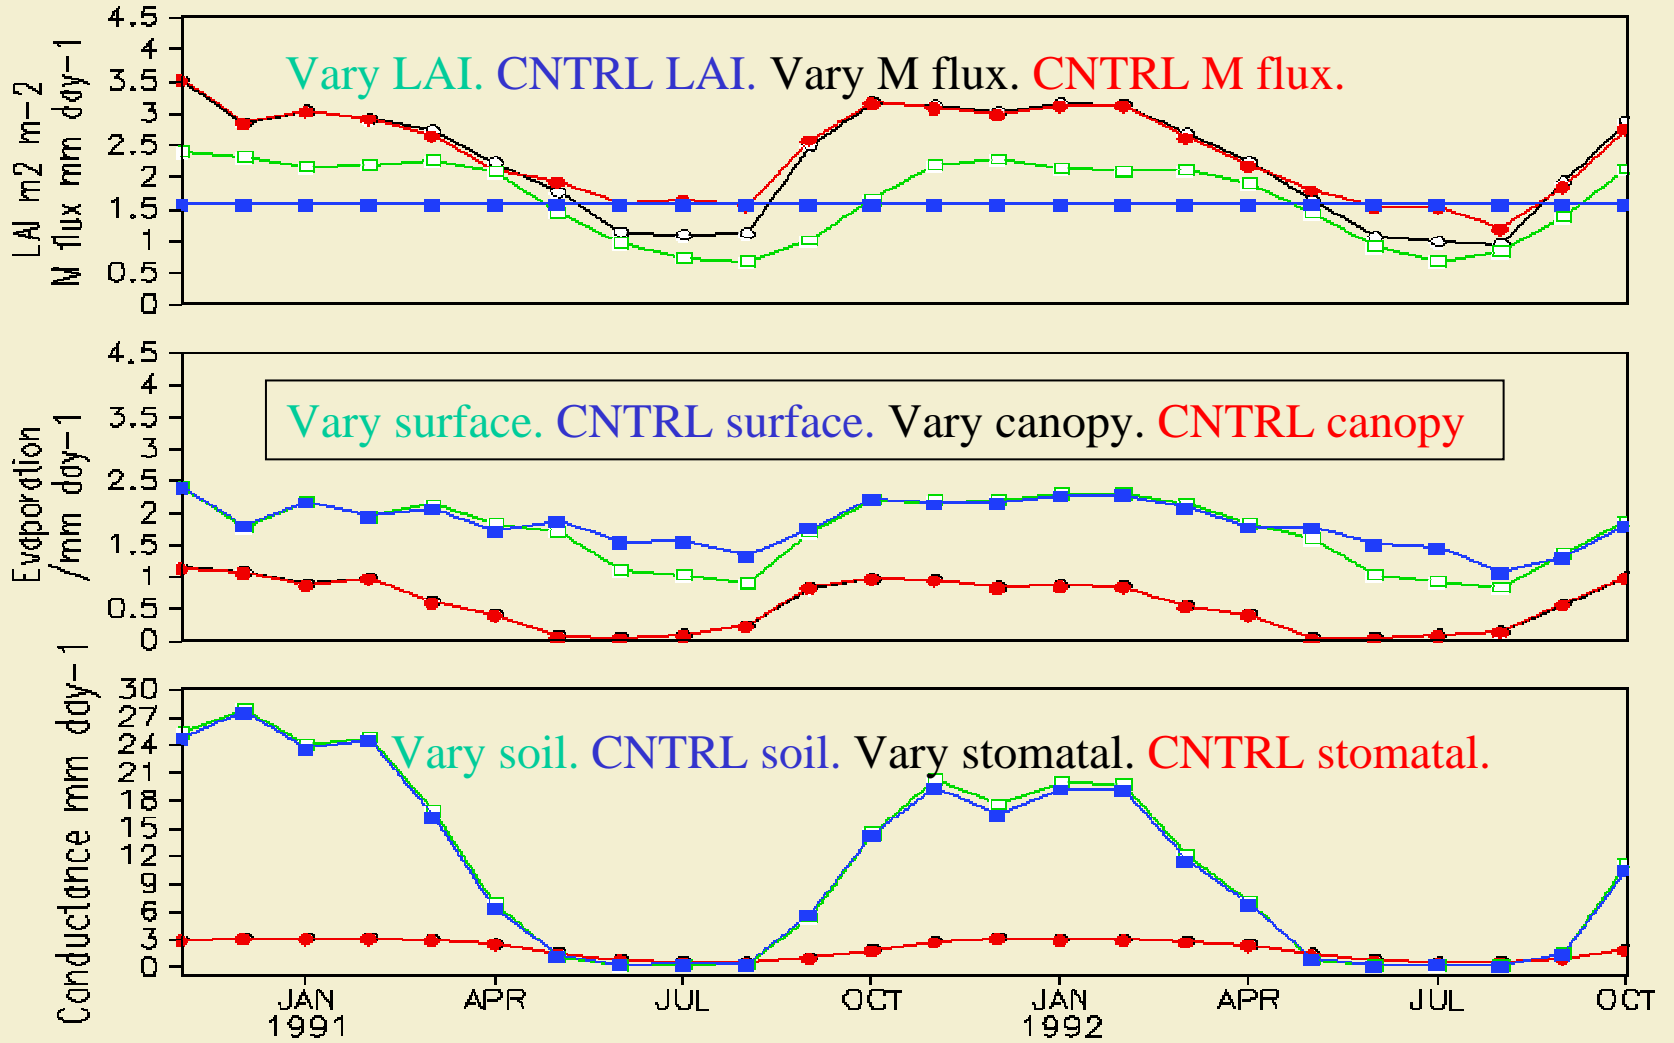

European case

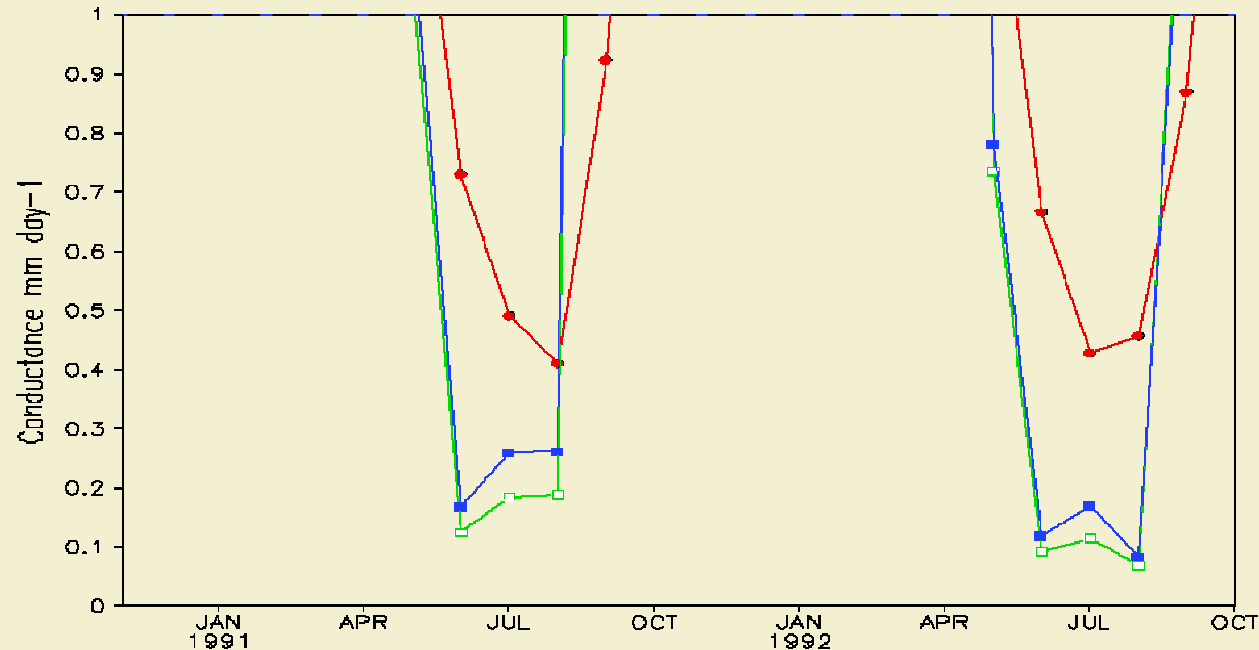

Moisture flux components
 Lat 45 to 55 Lon 15 to 25

African case

Moisture flux components
 Lat -13.5 to -4.5 Lon 17.5 to 28.5

$$R_{\text{soil}} = 100/g_{\text{soil}}$$

So a change in g_{soil} from 0.25 to 0.2, results in an increase in resistance 100ms^{-1} (400 to 500).

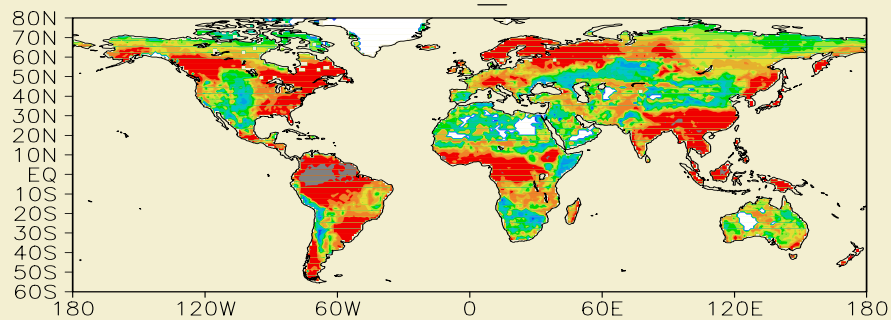

Influences of moisture fluxes in the model.

With no atmospheric interaction i.e. with one way meteorological forcing, the factors that influence the moisture flux are:

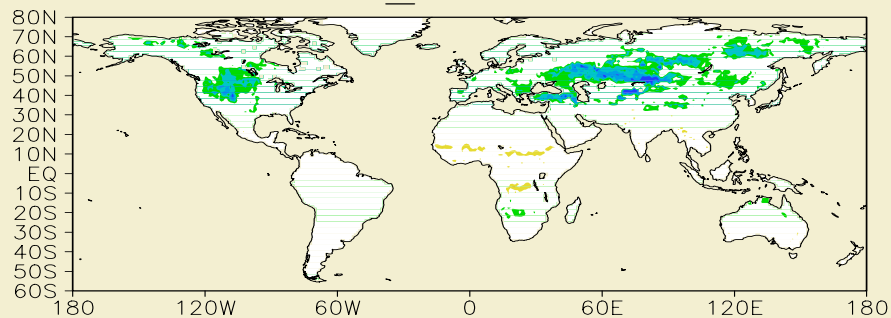

- Radiation interception,
- Soil moisture,
- LAI.

So LAI will only have an impact if the radiation and soil moisture are not dominant.

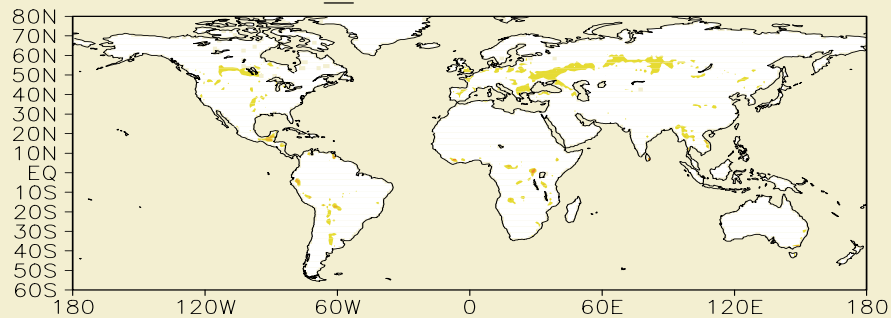

August soil moisture stress
VARY_LAI

Change August soil moisture stress
VARY_LAI-CNTRL

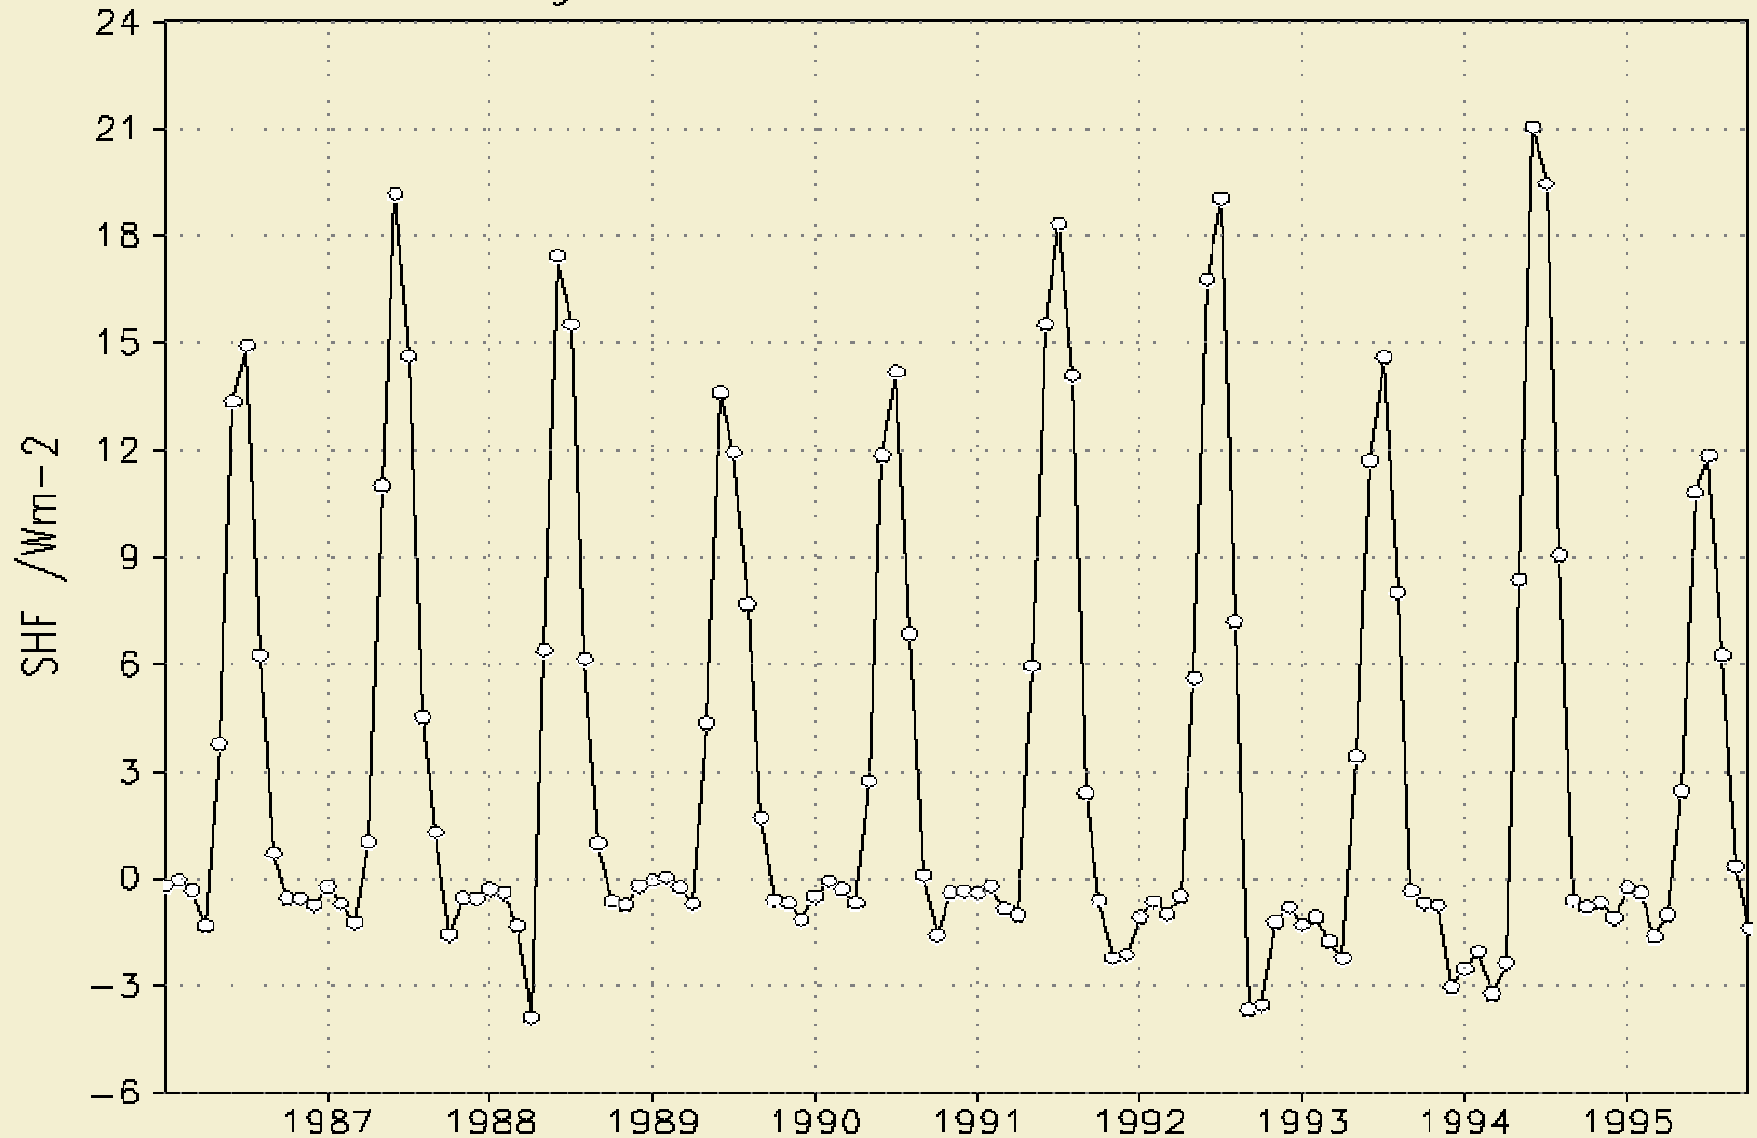

Change August soil moisture stress
L_MOD-CNTRL

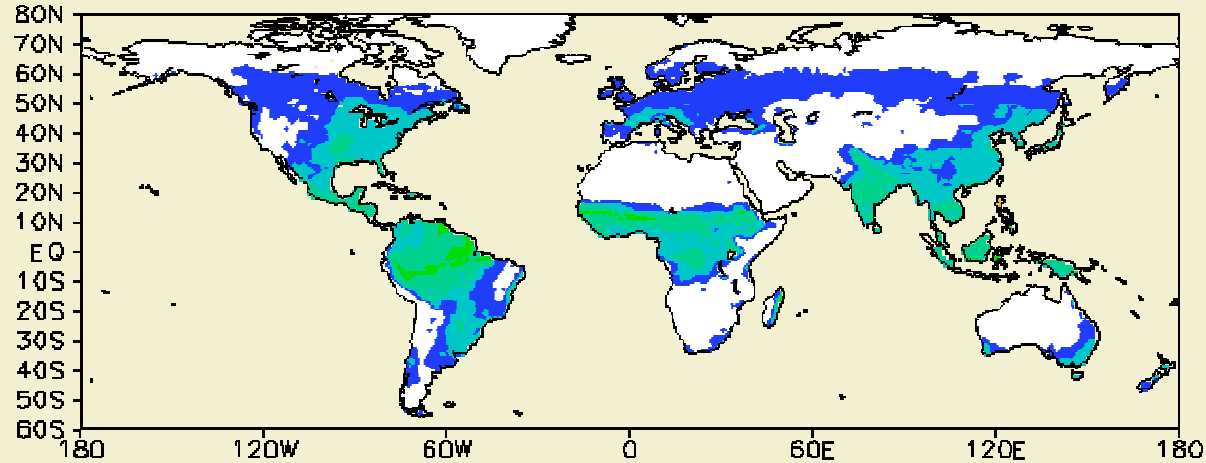

Improving land surface representation in the GCM.

- Use satellite data to identify regions of soil stress.
- Does the model show stress in these regions?
- If not why not?
-

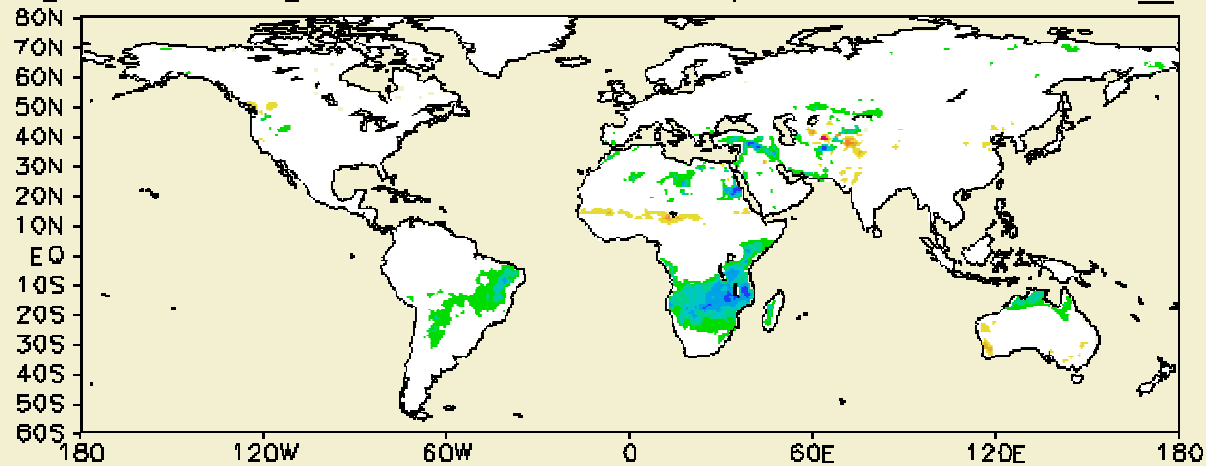

Difference S Heat flux:
Region Lat -12 to -4, lon 15 to 24

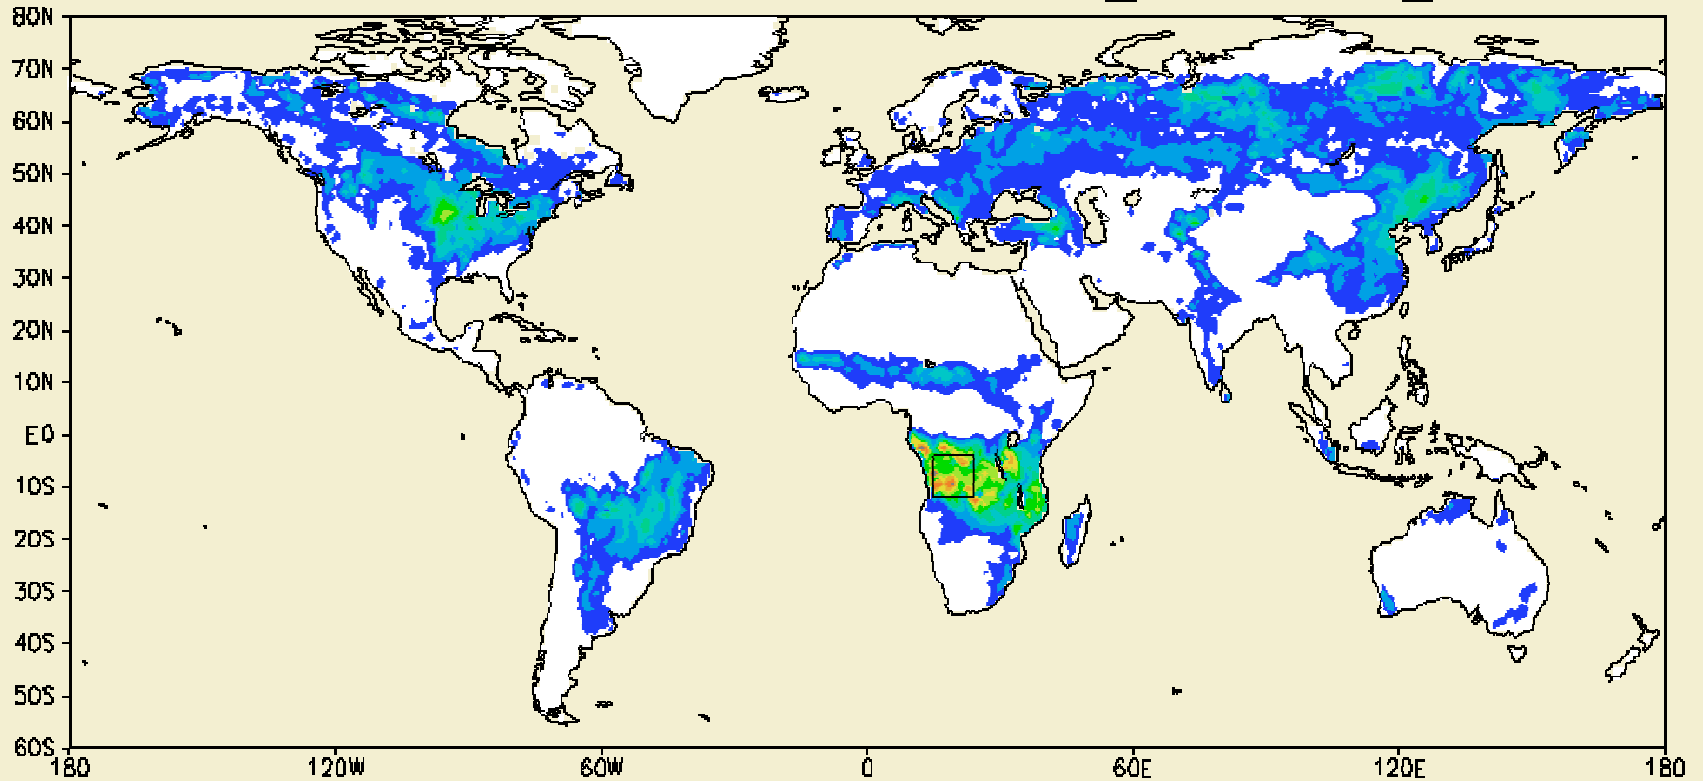

August evaporation VARY_LAI /mm day-1

Percentage change AUGUST evaporation VARY_LAI-CNTRL

Sum of absolute differences VARY_LAI-CNTRL_LAI

$$\Sigma \text{ABS}(\text{SHF}_{\text{VARY_LAI}} - \text{SHF}_{\text{CNTRL}})$$
