

JULES integrated impacts configuration

Annual JULES Meeting – Met Office – 26th June 2017

Integrated impacts concept

Met Office

Preliminary setup

- Version 4.7
- 0.5 degree, global
- 1980 to 2010, 3-hourly (WFDEI)
- Tile fractions from UM
- Crop fractions from Monfreda: Wheat, maize, rice, soy.
- prescribed sowing dates (Sacks)
- $I_{triffid} = F$, $I_{phenol} = F$
- Soil ancillary from CAP, $I_{vg_soil} = F$
- Vegetation parameters from TRENDY
- $irr_crop = 0$, 'real' irrigation fractions
- TRIP rivers
- Spin-up: 10 x 10 yr

Met Office

Plans for this configuration

1. Validate for present day (1980 – 2010) with observations as driving data (WFDEI)
2. Drive with HELIX HadGEM3 control run (N216 AMIP run with ERA-Interim SSTs 1980 - 2010)
3. Run with HELIX HadGEM3 future runs at specific warming levels (1.5, 2, 4 deg C...) : bias-corrected daily, so using disaggregator.

Met Office

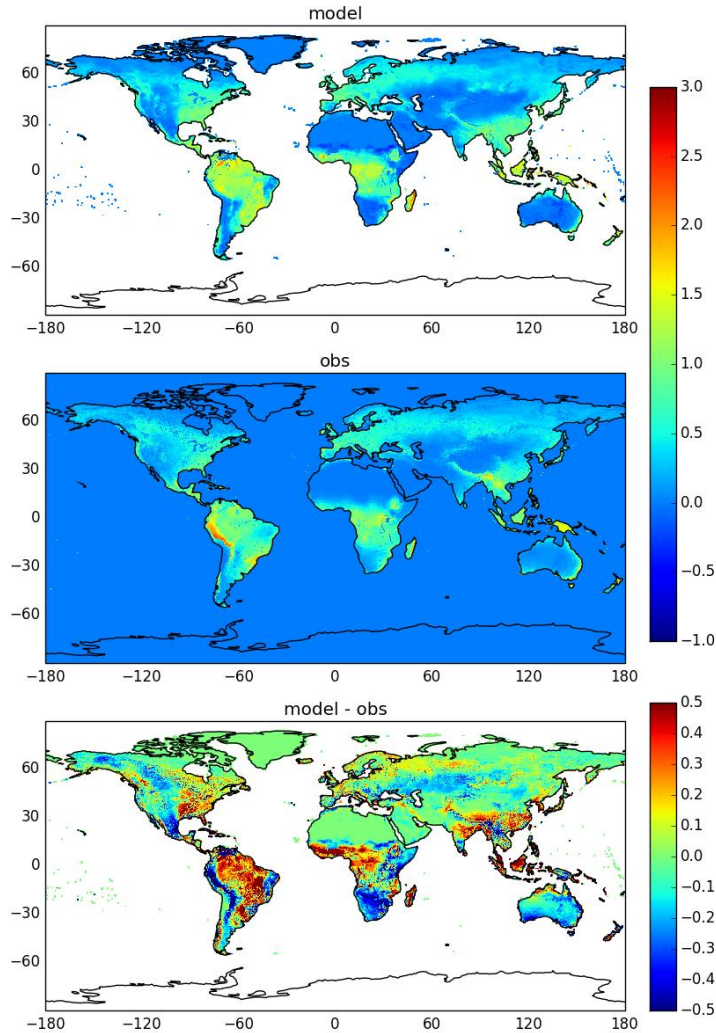

Validation datasets

- ET: Jung et al
 - Runoff: Fekete
 - NPP: MODIS
 - GPP: MODIS?
 - river flow: Dai
 - irrigation: FAOstat
 - crop yield: FAO?
-
- Validation metrics: as ISIMIP protocol?

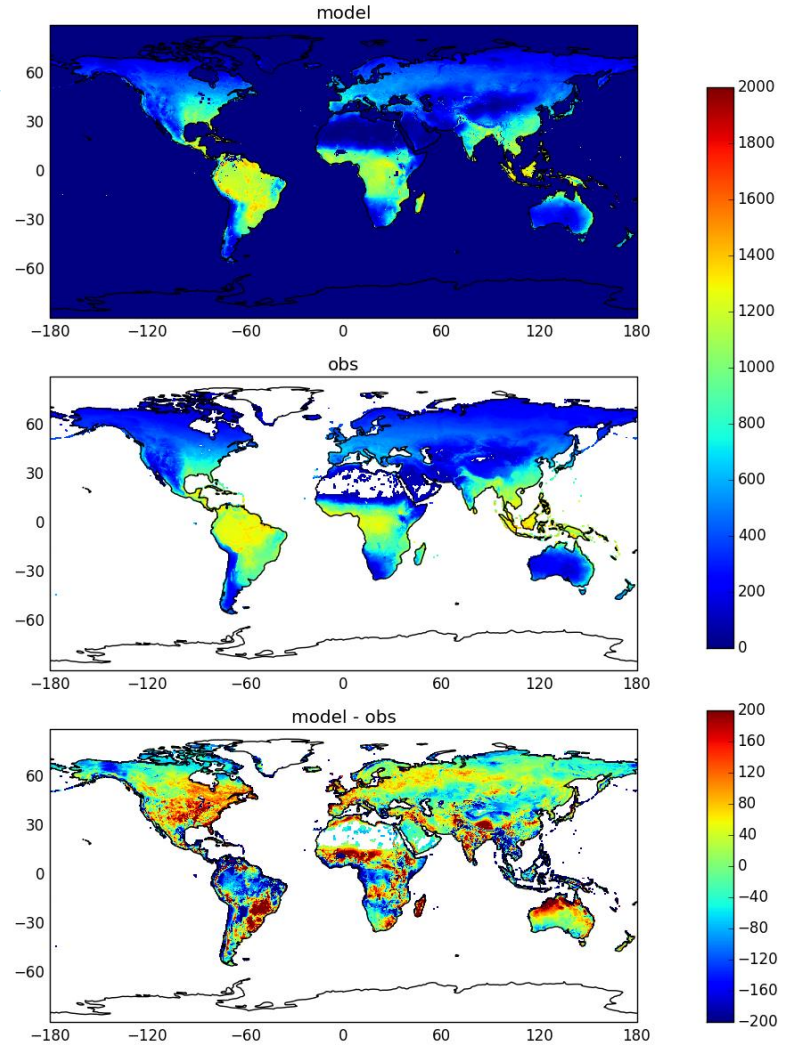

Early model-obs comparisons (using 'dummy' thermal time ancillary)

NPP
 $\text{kgm}^{-2}\text{yr}^{-1}$

ET
 mm/yr

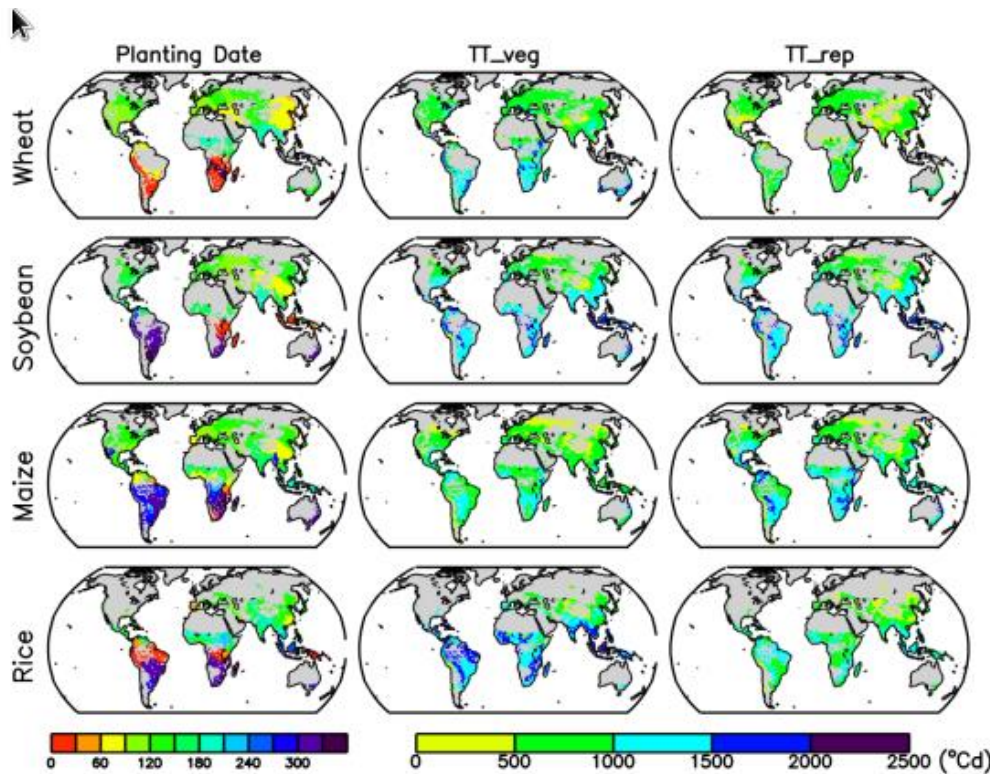

Met Office

Challenges(!)

1. Thermal time ancillary for crops

TT_veg = thermal time between emergence and flowering

TT_rep = thermal time between flowering and harvest

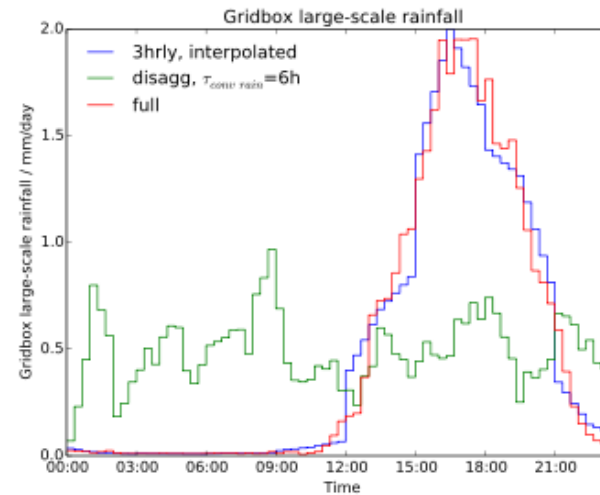

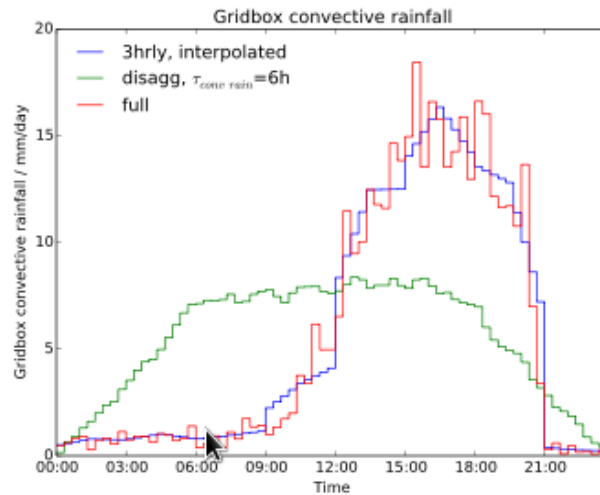

“ $x = (TT_{veg} + TT_{rep}) = 0.5, 0.45, 0.6, 0.6$ for soybean, maize, wheat, and rice, respectively”

Osborne *et al.* (2015)

Met Office

2. Disaggregation

Williams & Clark (2014)

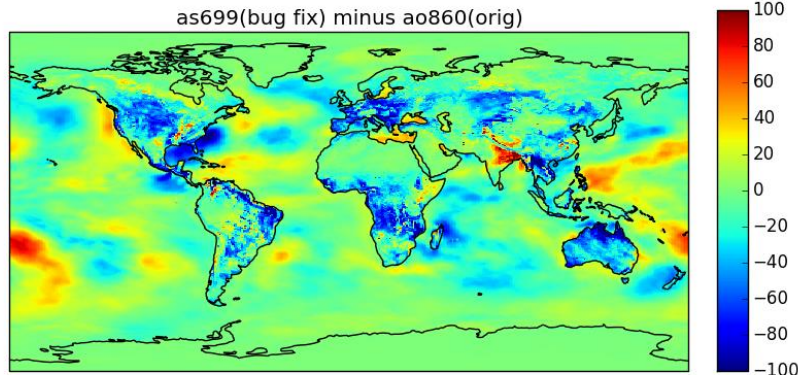

3. $I_{\text{vg_soil}}$ in the HG3 runs

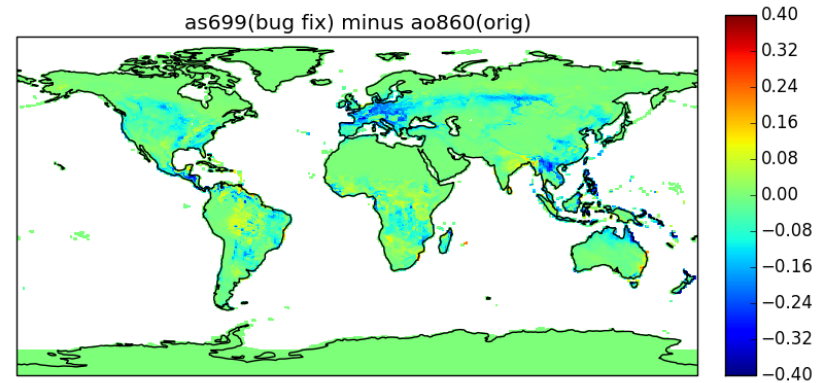

Met Office

Soils in HadGEM3

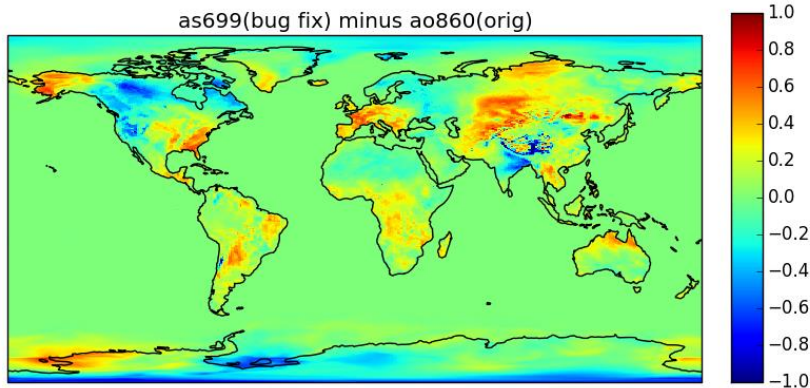

ET
mm/yr

NPP
kgm⁻²yr⁻¹

Surface
temp
K

$$I_{vg_soil=F} - I_{vg_soil=T}$$

Met Office

Soil moisture
kgm⁻²
