

Performance of the JULES land surface model for UK Biogenic VOC emissions

Garry Hayman, Edward Comyn-Platt, Ben Langford and Massimo Vieno

Centre for Ecology and Hydrology (Wallingford/Edinburgh)

JULES Annual Science Meeting
27th June 2017

Contents and Acknowledgements

- JULES land surface model and Biogenic VOC emissions
- Comparison against site measurements
- Comparison against emission estimates from the EMEP4UK model
- UK emission estimates

JULES: Biogenic VOCs

➤ Process-based model of the carbon, energy and water exchange between the land surface and atmosphere

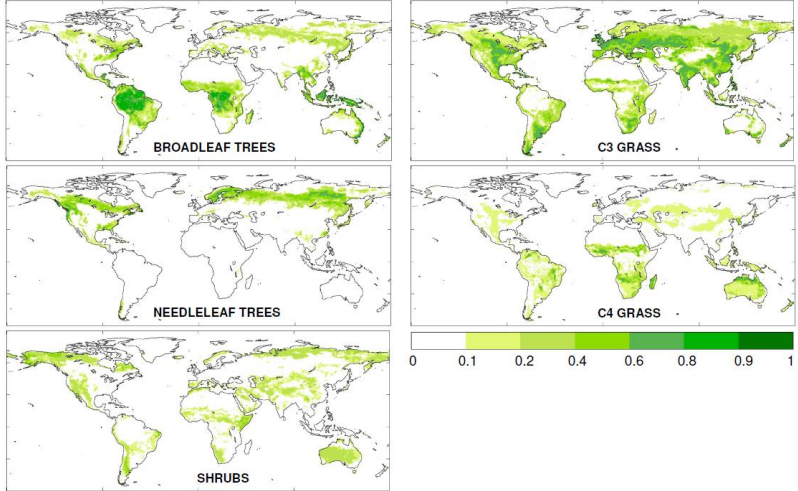

➤ Standard configuration uses 5 PFTs with emissions of four biogenic VOC species

➤ Isoprene scheme (Pacifico et al., 2011). Based on approach of Arneth et al., 2007 and Niinemets et al., 1999

$$I = IEF \frac{A_{canopy} + R_{Dcanopy}}{A_{st} + R_{Dst}} f_T \cdot f_{CO_2}$$

➤ Semi-empirical approach for the other species

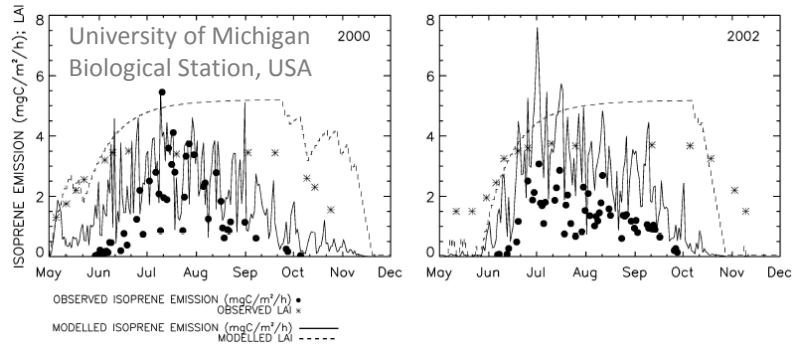

JULES PFT	Base Emission Factor (μg C g dry weight ⁻¹ h ⁻¹)	
	Isoprene	Terpene
Trees: Broadleaf	35	0.4
Trees: Needle Leaf	12	2.4
Grass: C3	16	0.8
Grass: C4 tropical	8	0.8
Shrubs	20	0.8

Evaluation of the Isoprene Emission scheme (Pacifico et al.)

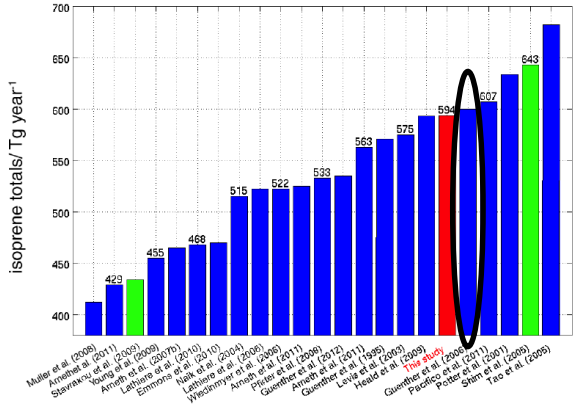

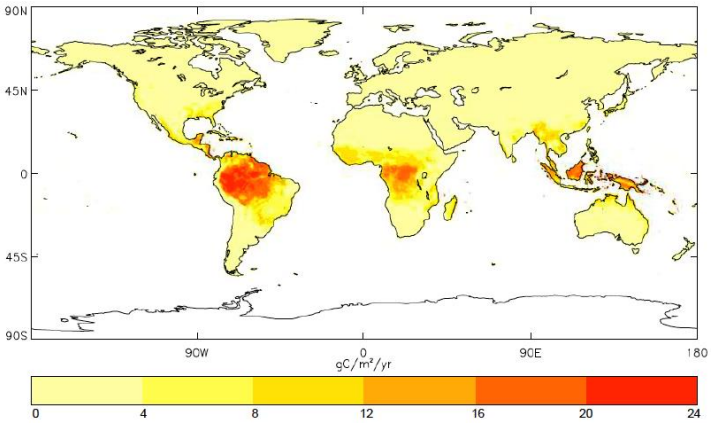

JULES captures the diurnal, day-to-day and seasonal variability at most of the above-canopy isoprene flux measurement sites.

JULES overestimates observed emissions at most sites, partly because isoprene loss through the canopy is not included, but it is also linked with the large uncertainty on pft-dependent Isoprene Emission Factors used (Guenther et al., 1996, J. Geophys. Res.).

Present-day (1990s) global estimate of isoprene emissions simulated with JULES is 535 Tg C yr⁻¹

In agreement with other published estimates (400-600 Tg C yr⁻¹, Arneth et al., 2008, ACP; Sindelarova et al., 2014).

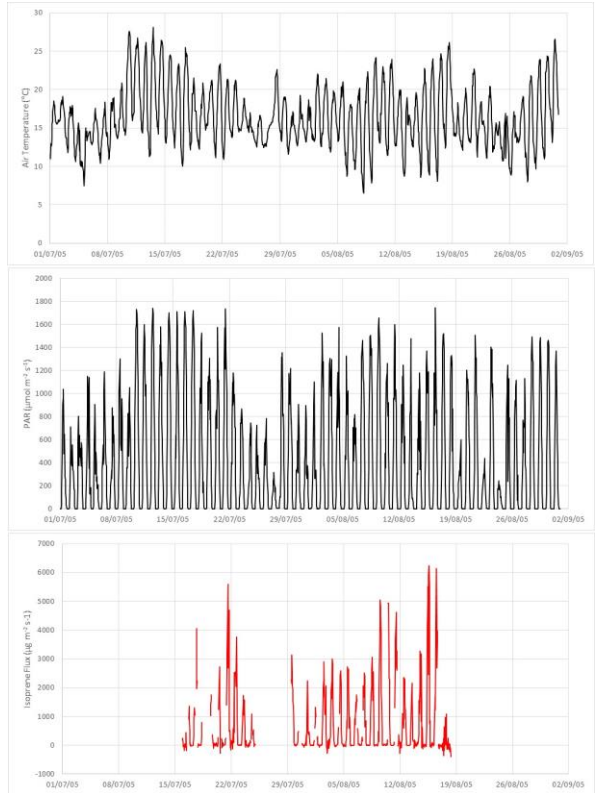

Scaled to 600 Tg yr⁻¹
Sindelarova et al., 2014

Biogenic VOC flux measurements

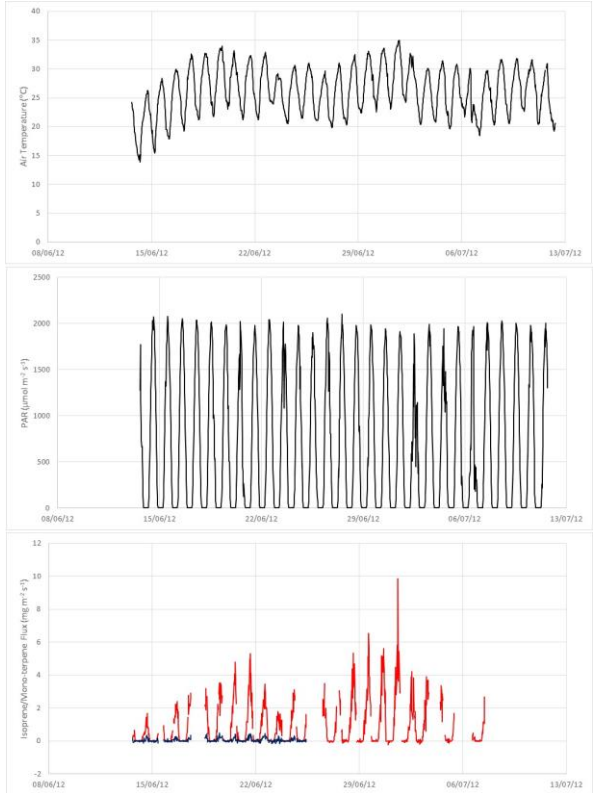

Alice Holt, UK July 2005

- Forest site in S. England
- 90% oak interspersed with 10% Ash
- Fluxes & concentrations of isoprene
- Langford et al.

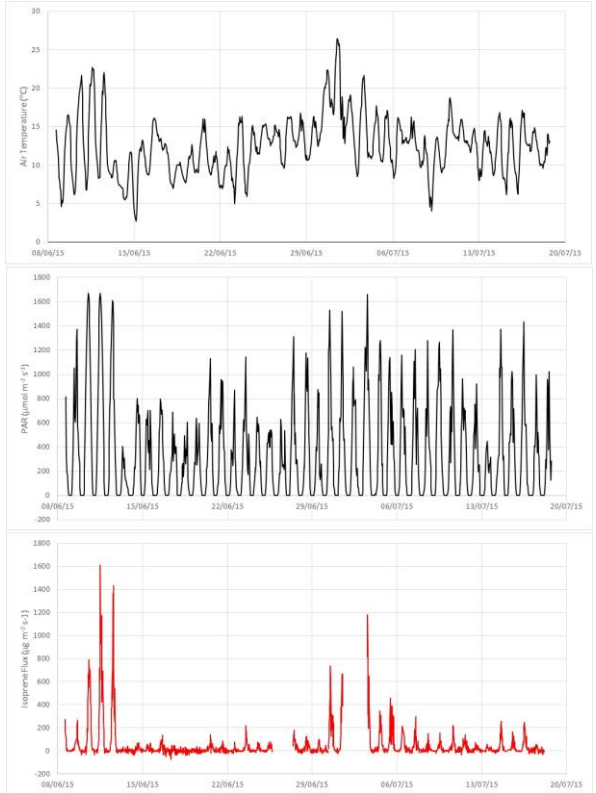

Bosco Fontana, Italy June/July 2012

- Semi-natural woodland, comprising a mix of oak and hornbeam
- Fluxes & concentrations of isoprene, terpenes, ...
- Acton et al., 2016, ACP

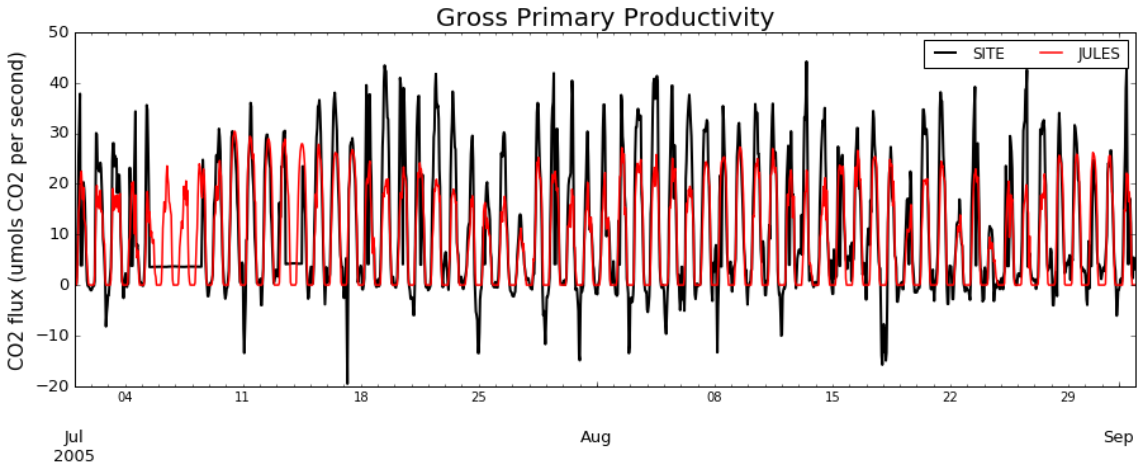

Auchencorth Moss, UK July/August 2015

- Ombrotrophic peatland
- Fluxes & concentrations of isoprene
- Langford et al., 2017, in prep

Comparison against Alice Holt measurements

- JULES runs with site-specific met and other parameters
- Comparison with observations of GPP and isoprene fluxes
- Strong sensitivity to isoprene emission factors

Plant functional types	Isoprene Base Emission Factor ($\mu\text{g C g dry weight}^{-1} \text{ h}^{-1}$)		
	EMEP4UK	JULES	MEGAN
Trees: Broadleaf	24.2	35	96.0

UK Biogenic VOC fluxes: Comparison against EMEP4UK

➤ EMEP4UK (r4.3)

- High resolution version of EMEP chemical transport model over the UK (5 km x 5 km)
- WRF as met driving data
- Model run from 2001-2014
- Vieno et al., 2010, ACP

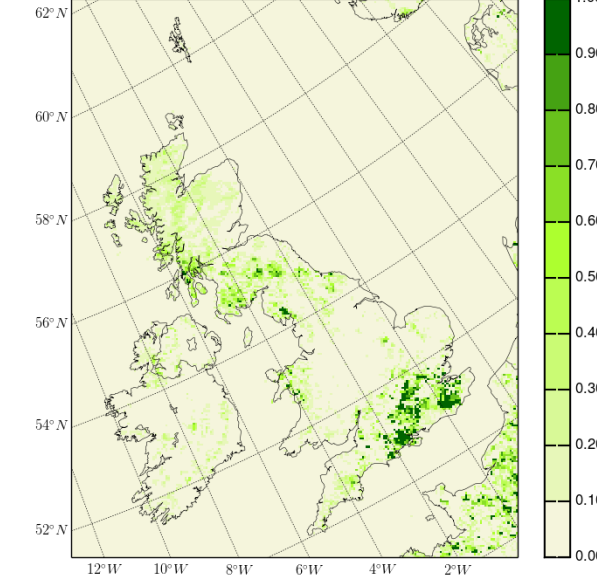

➤ JULES set-up

- Uses same model grid and driving met data as EMEP4UK
- Created JULES ancillary files on EMEP4UK grid
- Additional pft's added to match those used in EMEP4UK
- JULES run for 2001 to 2014

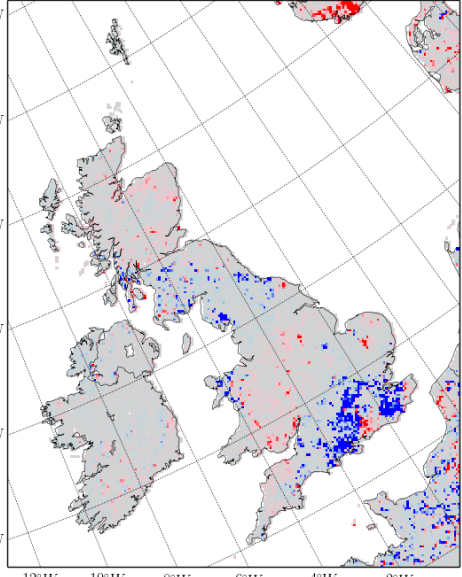

EMEP vegetation types	Foliar Biomass Density (g m ⁻²)	Base Emission Factor (µg g dry weight ⁻¹ h ⁻¹)		
		Isoprene	Terpene (light/temperature)	Terpene (temperature)
Trees: Temperate/Boreal Coniferous	1000	(1)	(0.5)	(2)
Trees: Temperate/Boreal Deciduous	320	(15)	(2)	(2)
Trees: Mediterranean Needle Leaf	500	(4)	(0.2)	(4)
Trees: Mediterranean Broadleaf	300	(0.1)	(10)	(0.2)
Crops: Temperate/Boreal	700	0.1	0.2	0.2
Crops: Mediterranean	700	0.1	0.2	0.2
Crops: Root	700	0.1	0.2	0.2
Moorland	200	5	0.5	0.5
Grass	400	0.1	0.5	0.5
Scrub: Mediterranean	150	8	0.5	2
Wetlands	150	2	0.5	0.5
Tundra	200	5	0.5	0.5

Comparison of isoprene fluxes

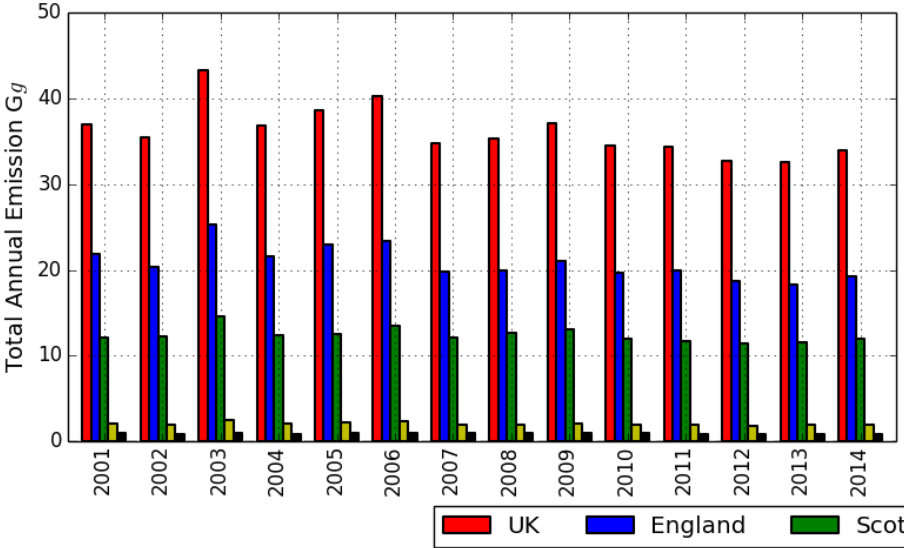

Mean Isoprene Emission Rate - EMEP4UK-rv4.3 - 2001,2014

Mean Isoprene Emission Rate Difference - EMEP4UK-rv4.3-Jv4.3.1-std-BC - 2001,2013

Mean Isoprene Emission Rate - Jv4.3.1-std-BC - 2001,2013

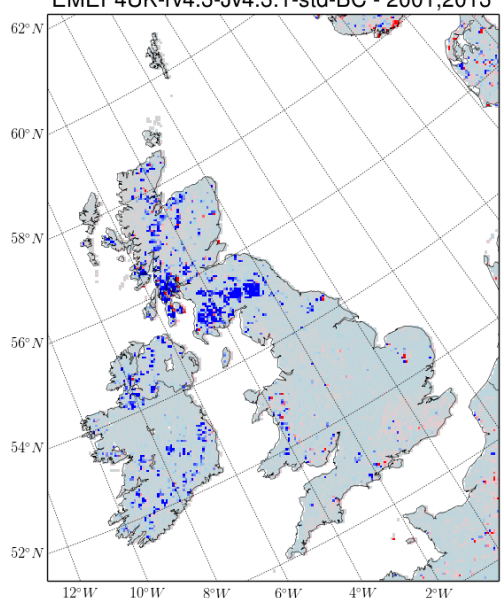

█ UK
 █ England
 █ Scotland
 █ Wales
 █ Northern Ireland

Comparison of terpene fluxes

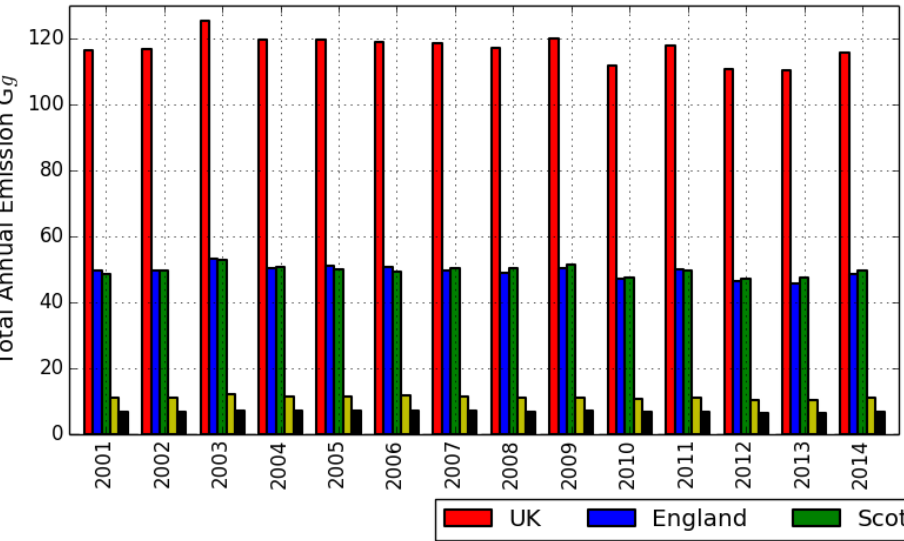

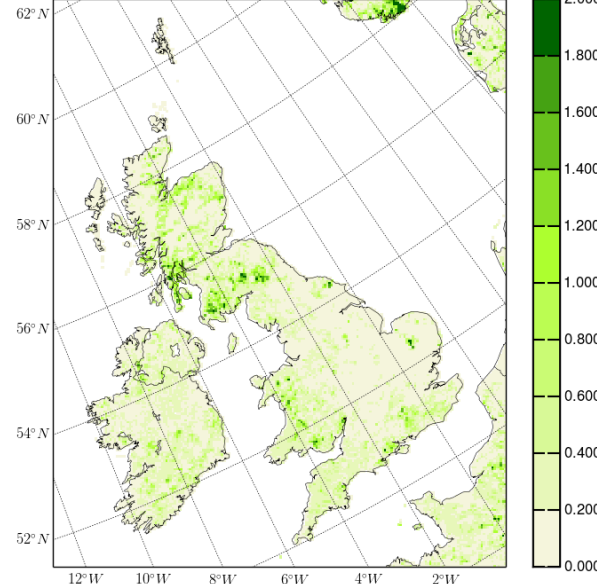

Mean Terpene Emission Rate - EMEP4UK-rv4.3 - 2001,2014

Mean Terpene Emission Rate Difference - EMEP4UK-rv4.3-Jv4.3.1-std-BC - 2001,2013

Mean Terpene Emission Rate - Jv4.3.1-std-BC - 2001,2013

NAEI (inventory years from 2003)	8	83			
This work					
• EMEP4UK	32.7-43.6	110.1-124.9			2001-2013
• JULES	20.9-37.8	44.6-71.3			
• CHES	26.0-32.1	87.7-103.9			

- JULES biogenic VOC emission fluxes compared to site measurements and EMEP4UK model
- Strong sensitivity to choice of base emission factors
- Need for UK-specific emission factors
- Need for more flux measurements (and over longer periods)
