JULES-ES

Andy Wiltshire and Spencer Liddicoat

Anna Harper, Eddy Robertson, Nic Gedney, Gerd Folberth, Alistair Sellar, Chantelle Burton, Chris Jones, Doug Clark, Doug Kelley, Eleanor Burke, Gerd Folberth, Lina Mercado, Peter Cox, Pierre Friedlingstein, Rich Ellis, Sarah Chadburn, Stephen Sitch, T Davies-Barnard, Sonke Zaehle (MPI), Stephanie Woodward
JULES is just a collection of code

A configuration has been carefully developed to set those options to work well together
What defines an experiment?

**Code version + Configuration + Experimental Setup**

- **Code version** is the JULES release – we aim for these to be scientifically comparable - i.e. it doesn’t matter which release you use.
- **The configuration** by definition is the collection of parameters, switches and ancillary information.
- **The experimental setup** is the driving data, resolution and experimental details – e.g. time varying CO$_2$, land-use etc.
What is JULES-ES?

• Latest Earth System Configuration used in UKESM and CMIP6
• Simulates: exchange of heat, water momentum, carbon, nitrogen, methane, BVOCs and the distribution of ecosystems
• Based on GL7 with additional processes
• Many uses, but includes advice of carbon budgets for stabilising climate given to policy makers.
What’s new?

JULES-ES is a substantial upgrade relative to HadGEM2-ES.

- Extended PFTs to 13 (5 trees, 2 shrubs, 2 grasses and 4 managed land classes)
  - Trait based physiology: parameterised based on huge datasets of measurements, classified in a way to capture the variation in functional trait
- Various improvements in Canopy processes, including a new canopy radiation module
- New interactive Nitrogen model downregulating growth during nutrient scarcity
- New land-use scheme separating land-use into C3, C4 grasses for crops and pasture
• Extended to include terrestrial Nitrogen Cycle
• Availability of N limits assimilation of Carbon and Turnover of soil Carbon
Benchmarking

Development Process

2. Get in touch with configuration manager (myself or Spencer)
3. Develop their own science, including lodging code to the JULES trunk
4. Benchmark the new run and share results code (present at annual JULES meeting) with configuration manager.
5. We’ll look ‘packaging’ together all the new developments and release a new version ~6 months before annual JULES meeting.
Summary

- JULES-ES-1.0 does a good job, but could be better… where the community comes in
- We could have better parameters based on more data and/or observational constraints
- We could have more and/or improved processes – interactive fire, permafrost
- But, we need the model to perform well and be reliable. This is where the benchmarking comes in.
